An **OPG (Orthopantomogram)** provides a 2D overview of the entire mouth, making it ideal for routine check-ups and orthodontic planning. A **CBCT (Cone Beam Computed Tomography)** scan generates highly detailed 3D images, which are essential for complex procedures like dental implants, impactions, and root canals.

	OPG	CBCT
Image Dimension	2D (Flat, two-dimensional view)	3D (Volumetric, 360-degree view)
Radiation Dose	Very low (comparable to a few days of background radiation)	Higher than OPG, but significantly lower than traditional medical CT scans
Cost	Less expensive	More expensive
